Introduction

Project overview

The primary objective of this project is to Developed weather forecast application using JavaScript, HTML & CSS. This application retrieves weather data from an API, display it in a user-friendly interface, and provides essential features such as location-based forecasts, current weather conditions, and extended forecasts. The application emphasizes simplicity, responsiveness, and reliability, ensuring a seamless experience across devices.

Goals

Real-Time Weather Data: Ensure users receive live and up-to-date weather information by integrating a reliable weather API.

User-Friendly Design: Create a sleek, modern, and responsive interface using Tailwind CSS for better accessibility and ease of use across various devices and screen sizes.

Global Coverage: Allow users to search for weather forecasts for any city or location worldwide.

Usage Instructions

Open the Software

- Launch the Weather Forecast on your computer

Search for a Location:

- In the search bar, type the name of a city or location for which you want to check the weather. Then press Enter or click the search button.

View Weather Details:

- After the search, the application will fetch data from the connected weather API (OpenWeatherMap) and display details such as:
 - **Temperature** (in degrees Celsius, based on API settings).
 - **Weather Condition** (e.g., sunny, rainy, cloudy).
 - **Humidity Level**.
 - **Wind Speed**.

Tools & Technologies

Tools

- VS Code (IDE used for writing codes)
- GitHub (<https://github.com/amar-jeet-9494/weatherForecast.git>)

Technology

- HTML (Used for develop structure of the web App)
- Tailwind-CSS (Used for styling the web App)
- JavaScript (Used to implement functionalities of web App)
